Q.5) Solution (d)

Acrylamide is a chemical used primarily in making polyacrylamide and acrylamide copolymers that are used in industrial processes such as a production of dyes, plastics, paper. It is also used in treatment of drinking water and waste water.

Acrylamide is present in many types of food such biscuits, cakes, bread, coffee, toast, crisps, chips, and other starchy food. It is a natural byproduct of the cooking process. It is produced when Asparagine, a building block of proteins found in many vegetables is heated to high temperatures in the presence of certain sugars. Cooking methods such as baking, frying, grilling, and roasting mainly results in production of acrylamide. The darker the colour gets of the food; more acrylamide is present in it.
